

METHOD AND APPARATUS FOR PROVIDING GROUP INTERACTION VIA
COMMUNICATIONS NETWORKS

ABSTRACT

1 A system for communicating between members of a group is disclosed which
2 includes a communications interface transmitting at least one of voice, video and text
3 communications from an originating member to at least one destination member and a
4 graphical communication flow module graphically depicting to each member of the
5 group a representation of each of the members of the group. The graphical
6 communication flow module graphically depicts communication flows from the
7 communications interface such that members may view communications flows
8 independent of the content of the voice, video and text communications transmitted by
9 the communications interface.
